

MATERIAL 3 CASE STUDY

Now in Android App with Material 3

link to figma file

COLOR GUIDANCE

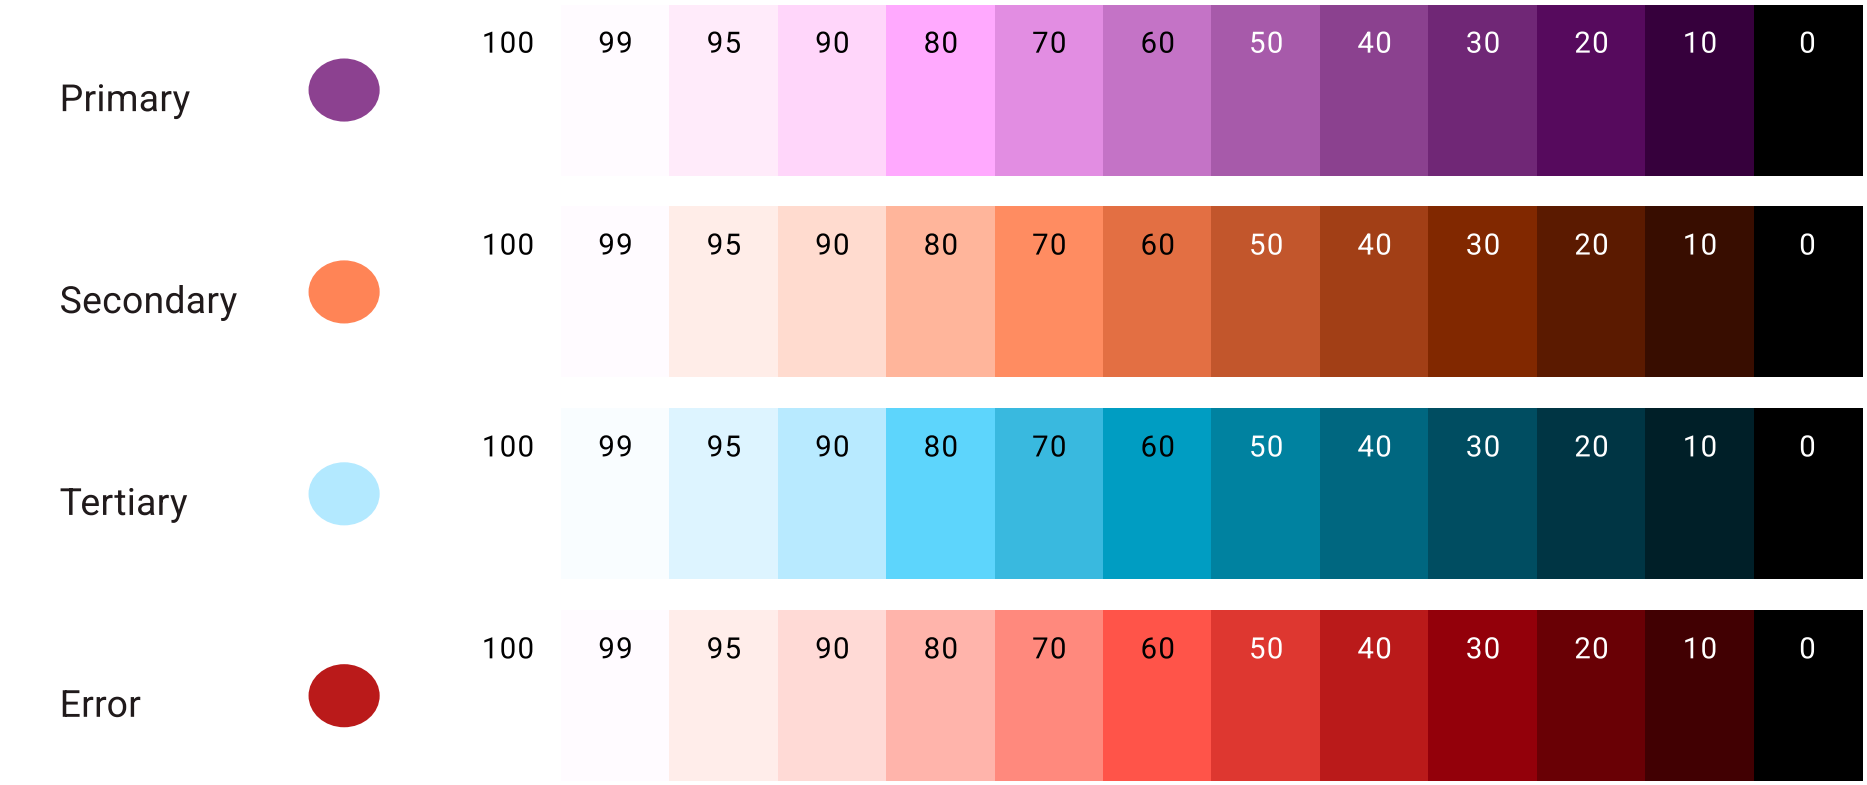

Color is used to express style and communicate meaning. With dynamic color, Material puts personal color preferences and individual needs at the forefront of systematic color application.

These color styles were generated using the Material Theme Builder however we altered the Neutral color set with custom colors. This allowed us the opportunity to show developers how they might alter M3 styles if required within the opensource code base.

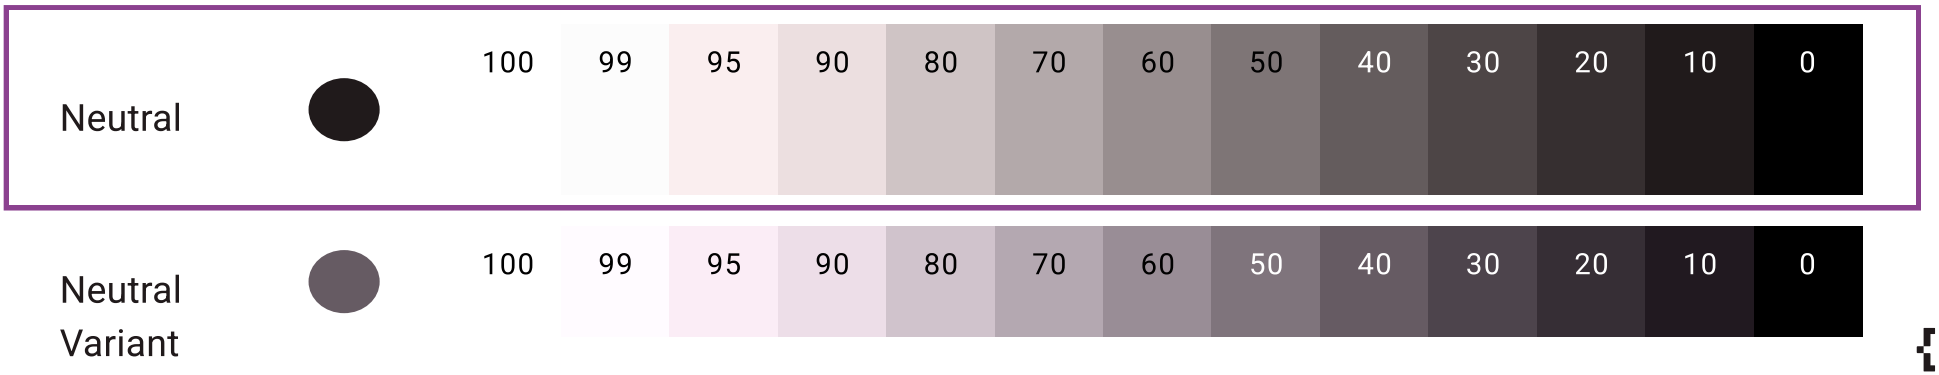

Note
If you customize colors beyond what M3 dynamically generates you must carefully test these colors contrast accessibility.

TYPOGRAPHY

Use typography to make writing legible and beautiful. Material's default type scale includes contrasting and flexible styles to support a wide range of use cases.

ILLUSTRATIONS & ELEMENTS

Icon elements use Material design icons or were custom built.

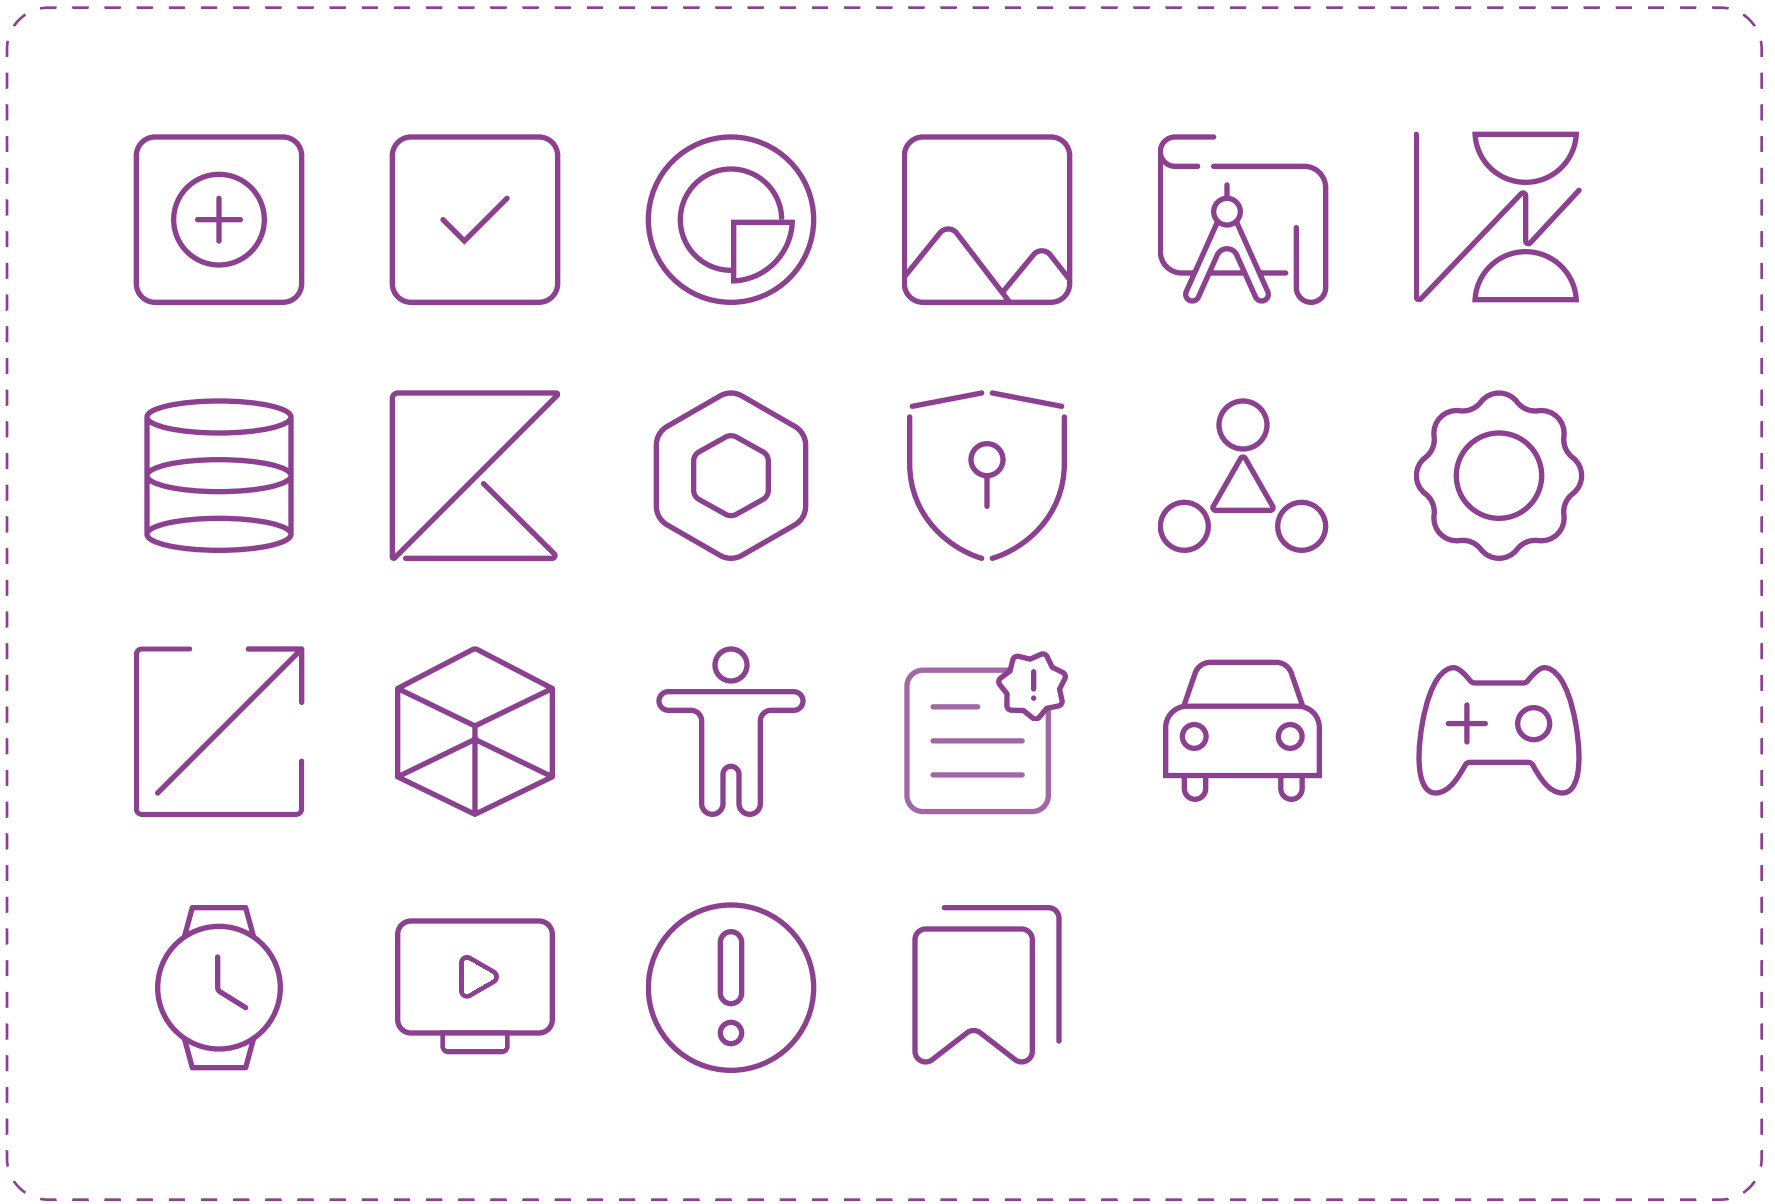

The illustrations use nested components and masks. This makes it easier to create alternate themes, but it has the trade-off of adding size to exported SVGs.

Gradient colors in figma don't currently allow for style names but require hex numbers instead. So that gradients styles can be dynamically themed we used gradient masks and selection colors to create gradient components.

(Resized and/or cropped to fit this view.)

Medium (905-1239dp)

(Resized and/or cropped to fit this view.)

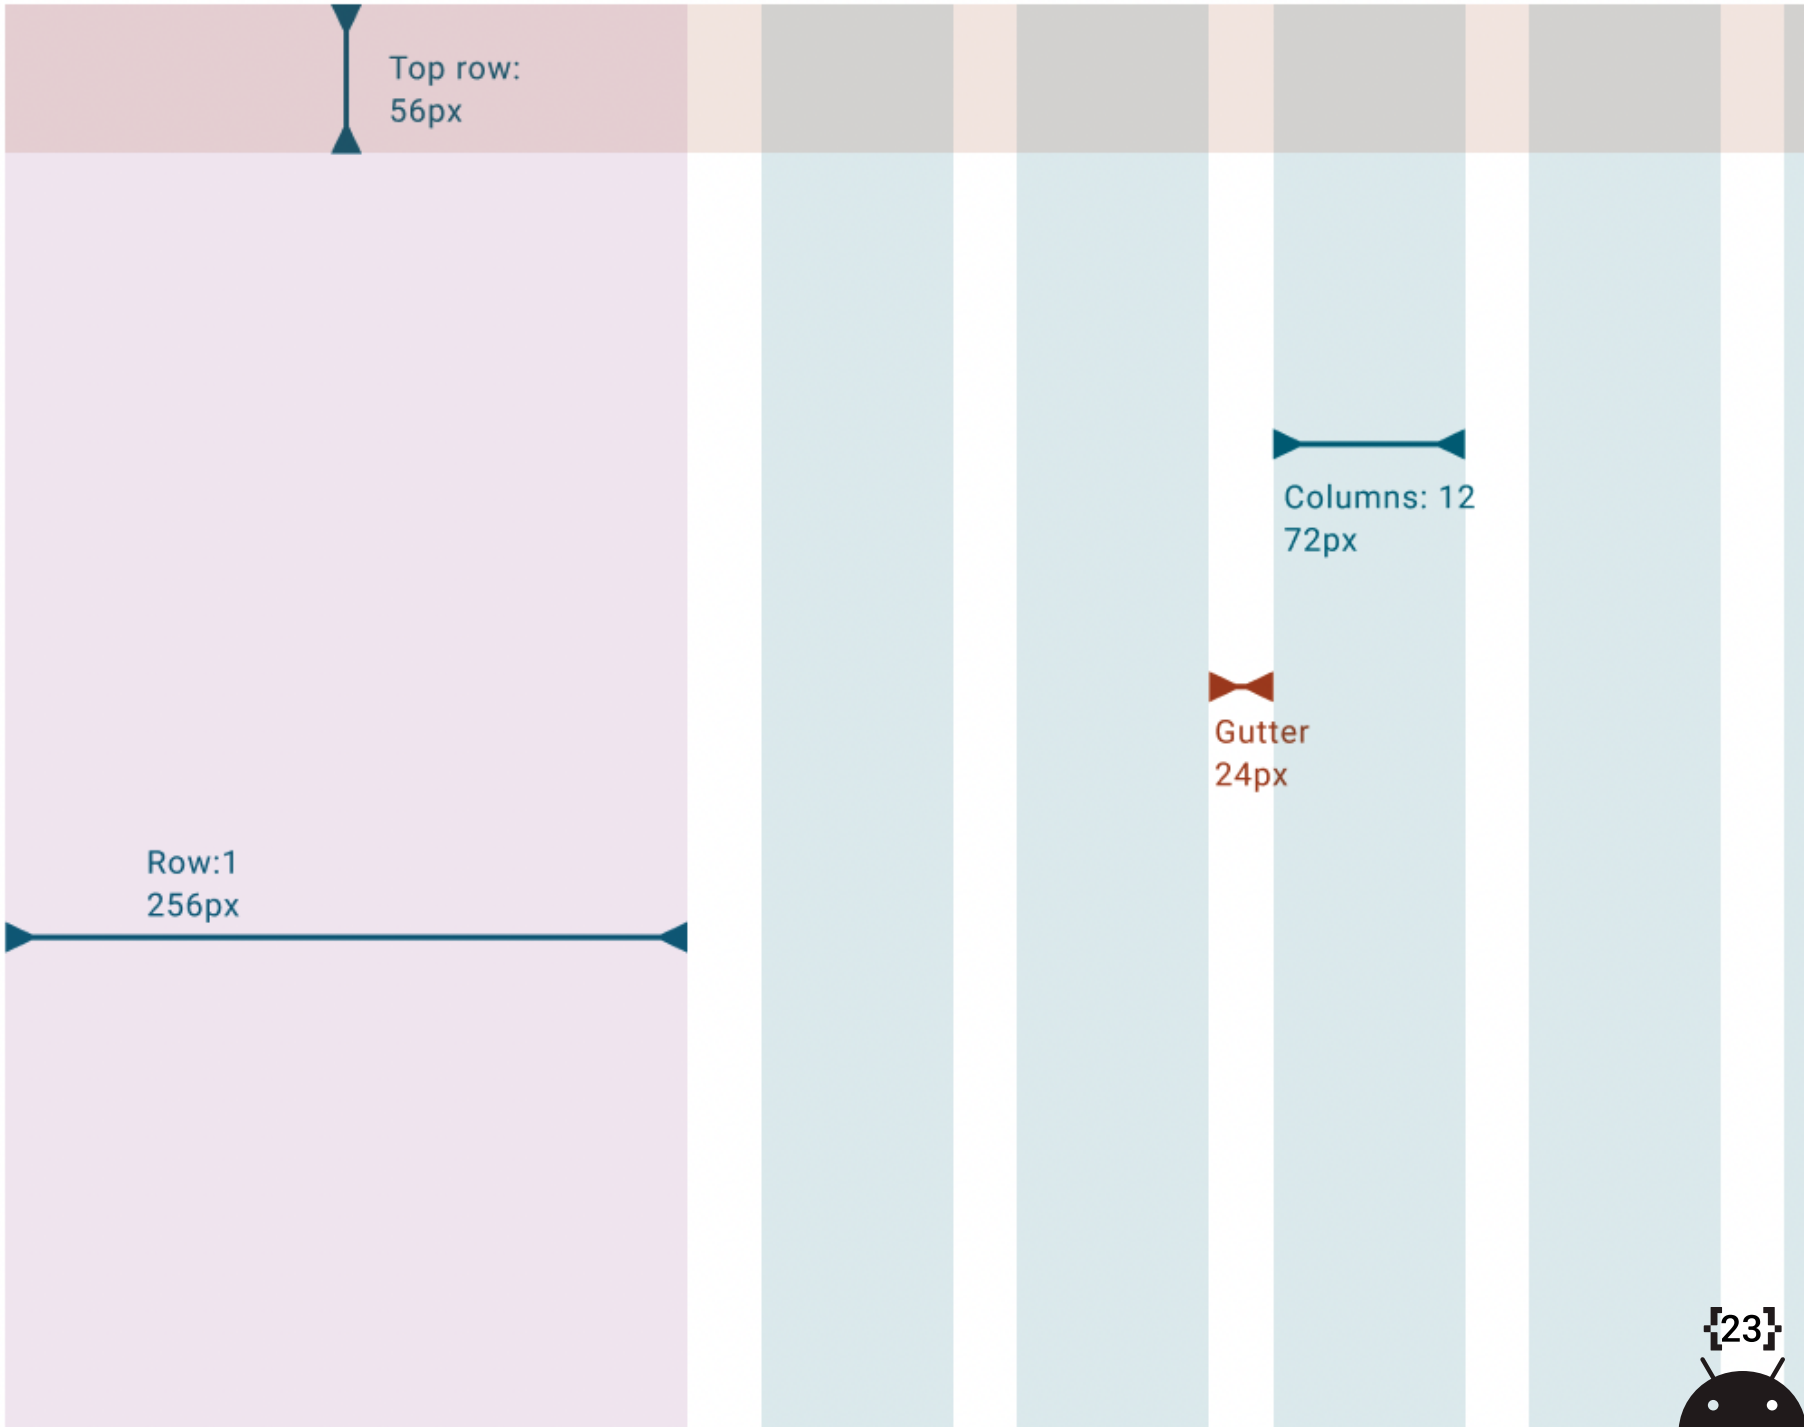

Medium (1240-1439dp)

(Resized and/or cropped to fit this view.)

Large (1440+dp)

(Resized and/or cropped to fit this view.)

COMPONENTS

The figma Material 3 Design Kit was used to originally design the components for this file and are reccommended for building out M3 components.

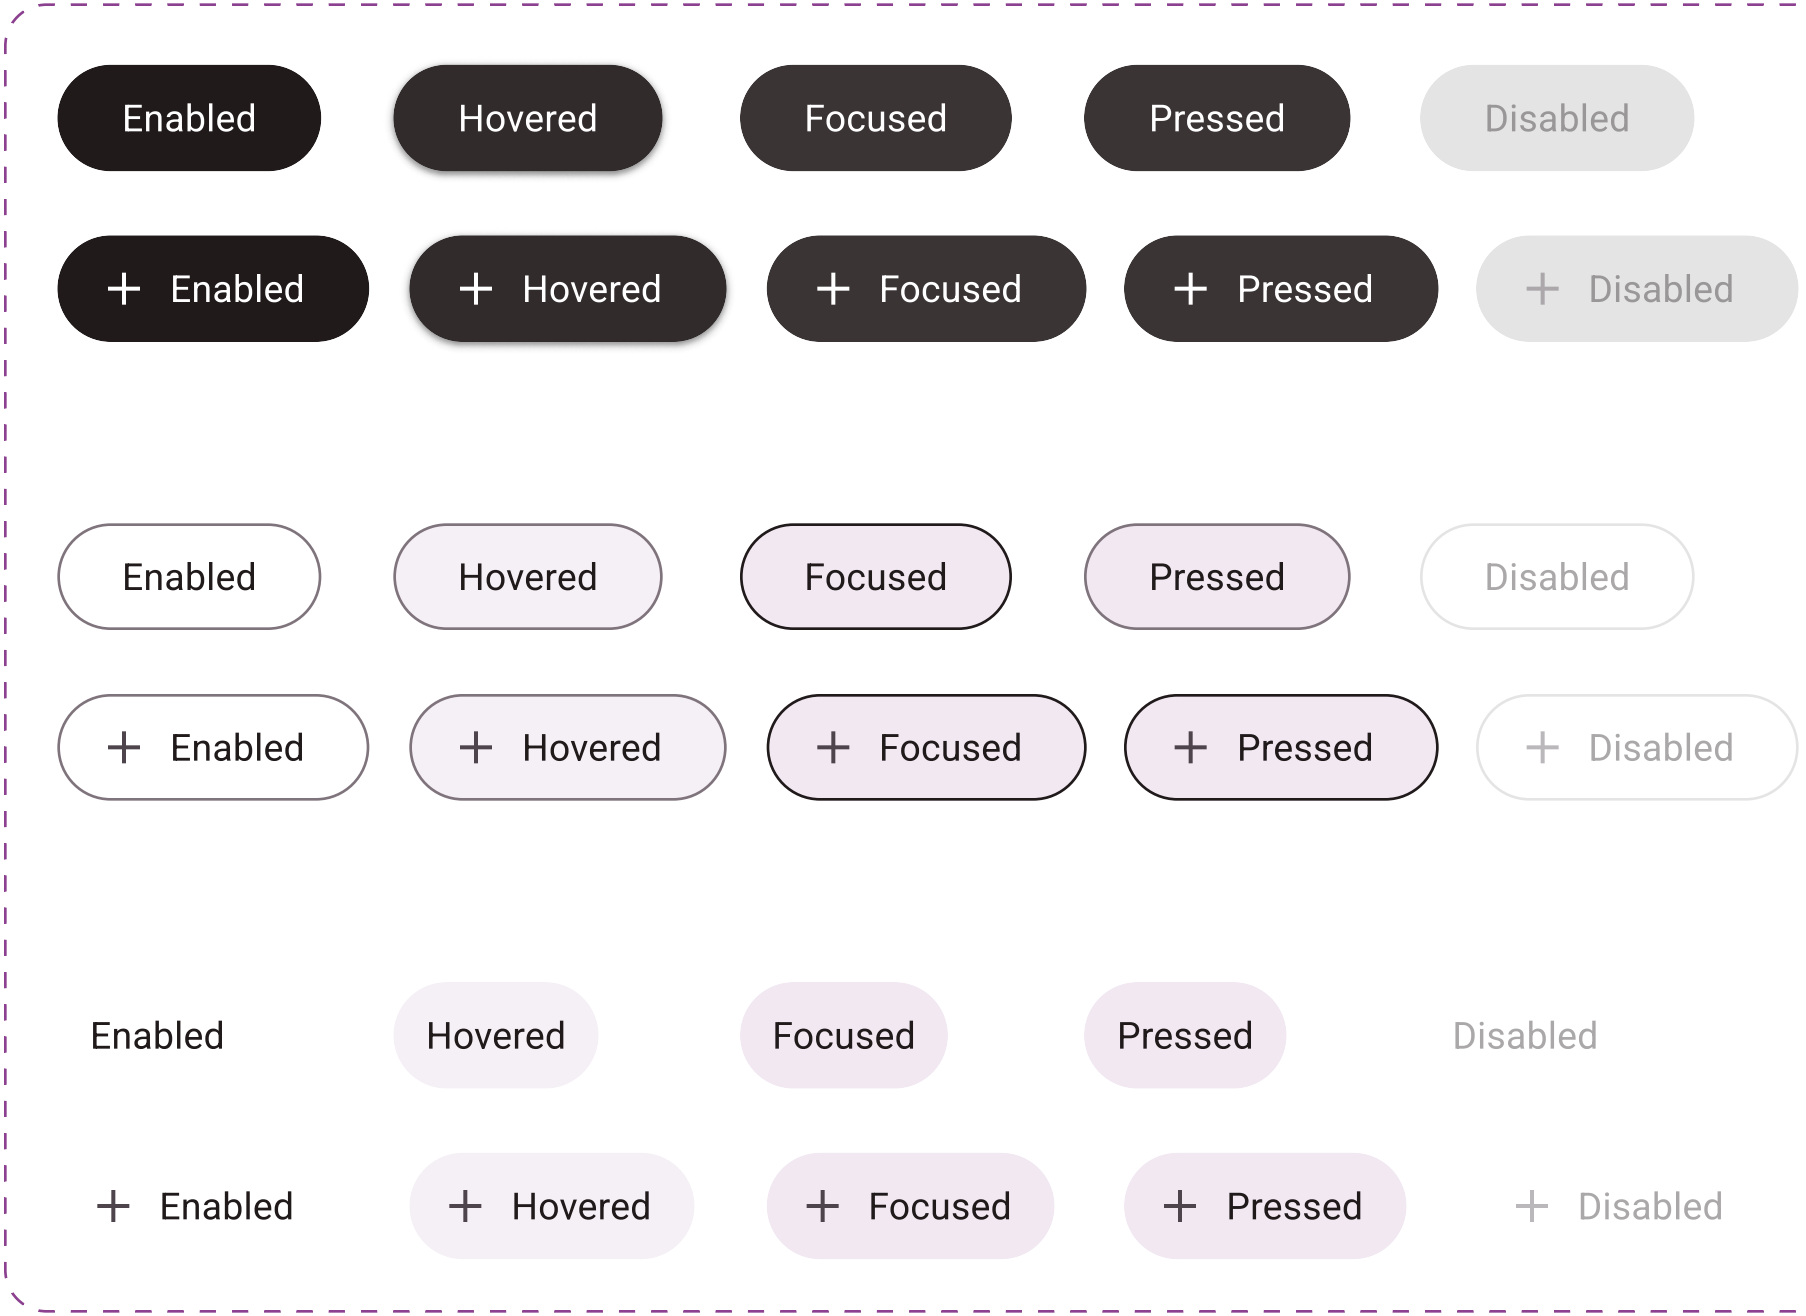

Some components have been customized beyond the colors and fonts from the Material 3 Design kit and the Material theme builder styles. We have marked these components as custom. Also we have generated what the components would have looked like without customization.
This type of customization provides real world learning examples in the app for developers.

★ Custom color styles

Note
If you customize componets beyond what M3 offers you must carefully test these components for accessiblity.
